

ONIQ MASTER SUPERLOOP — PASS 01: DISCOVERY

Read-only pass. No code edited, no migration run, no function deployed, no production data written.

What the app actually is

ONIQ ships as a Capacitor WebView pointed at <https://oniqhub.com>. The Android app and the website are the same deployment: a web publish changes the app for every installed user without a Play release — and does ****not**** carry edge functions. Play shows 1.8.3 / 18 Aug 2026, and `android/app/build.gradle` agrees (versionCode 19, versionName 1.8.3). 111 public tables, 53 edge functions, 4 active cron jobs, 78 route files, 1825 passing tests across 121 files.

The three-way reconciliation

Full matrix in `product_truth_map.json`. The headline: the Play listing, the website and the code each describe a different product.

****Play advertises things that are not there.**** "Crypto and investing launchers" has no counterpart anywhere in the source — the mini-app registry has twelve categories and neither of those is one of them. "Live weather" exists as a route and a server function but nothing in the entire UI links to `/app/weather`. "Compares ride options across nine providers" describes a static rate card; the website's own wording ("fare estimates") is the honest one.

****The website undersells and mislabels.**** Jobs is tagged "Coming soon" while 25 CVs have already been generated in production. ONIQ Learn is advertised with an empty course catalogue (0 courses, 0 lessons, 0 questions).

****The code carries things nobody has announced.**** Study is the single most-used feature in the database — 1,164 chapters, 154 tutor messages, 87 exam papers, 67 quiz attempts — and appears nowhere in the Play listing. The paid Story/Originals pipeline (46 jobs, 8 price tiers, two crons) is likewise undisclosed. So is a public MCP tool surface.

****One world is dead in both directions.**** Food ordering has no inbound link anywhere in the UI *and* zero restaurants, zero menu items, zero orders — while still carrying a money-path RPC.

What is genuinely working

Chat (833 messages, 57 conversations), Calls (325 call logs, TURN configured), Moments, Updates, Mast, Study, Blessed, Pulse, Official, Plug (149 visible mini-apps, matching the site's number exactly), Jobs, Vitals, and the DSR export/delete machinery with both purge crons running every 15 minutes. RLS is enabled on all 111 tables — the listing's security claim holds.

Credentials are a bigger gap than code

Nine secrets are referenced by deployed code and are not configured. The ones that matter: MAPPLS_CLIENT_ID/SECRET (India geocoding for Rides and Scout), RAZORPAYX_ACCOUNT_NUMBER (creator payouts cannot be initiated at all), and AMADEUS_* (flight search cannot succeed). On the good side, the client-side exposure check is clean — only the publishable Supabase values reach the browser.

Nothing is marked PRODUCTION_READY

Every candidate feature fails the last clause of your own definition: runtime proof on a real device. Calls, push delivery, camera QR scanning, offline behaviour and chat scroll performance are all marked [HW] in the gap ledger. Green tests are source assertions, not evidence that a handset rings.

Ranked gaps

Seventeen entries in gap_ledger.json, ranked by user harm then store exposure. The top three are the Play crypto/investing claim (a financial-services claim with no implementation — Play treats these strictly), the nine-provider ride pricing claim, and the advertised-but-unreachable weather screen. Four items are marked owner_decision_needed because they are business calls, not engineering ones: whether to build crypto tiles or drop the claim, whether to buy live ride pricing, whether to retire or seed Food, and whether to fund the payout account.

Artifacts

oniq_master_audit/ — build_identity.json, product_truth_map.json, backend_registry.json, route_map.json, gap_ledger.json, this report.
